

Agile Software Testing

The Client:

The client is a global leader in web-based environmental monitoring software that collects data, creates reports, and triggers alarms. The software allows users to set alarms that trigger alerts on-screen, via email, via SMS, and via telephone.

Challenges:

The client had challenges in delivering a high quality product on time because they had limited testing resources and limited in-house knowledge of the testing process.

Their test cases did not cover the software's complete functionality. Also, due to their frequent build cycle, new builds required regression testing.

The client needed a partner who could help with improving the quality of testing and who could provide resources at short notice for execution.

Solution:

Optimus analyzed existing test cases and re-organized them into a proper format. Optimus worked closely with the client to write new test cases in order to improve the test coverage using a Risk Based Testing approach.

During the client's frequent build cycle, new builds were sent directly to Optimus' offshore team for quick turnaround.

Optimus' local Test Manager worked with the client to provide a seamless integration using Optimus' Hybrid Delivery Model.

Benefits:

With Optimus' help, the client was able to meet their product release deadline with a high quality product.

Now the client has a deep partnership with Optimus, relying on Optimus for testing expertise, quick turnaround and flexibility.

The client also enjoys all the benefits of partnering with local company while achieving an attractive cost structure.

Conclusion:

Optimus' testing expertise, coupled with a Hybrid Delivery Model, gives clients flexibility and scalability at a reduced cost. The result is a quality product that has been well tested using the latest testing methodologies, processes, and automation.

"With the help of Optimus, we were able to deliver our product on time, under budget, and with the confidence we needed to guarantee reliability."

~Product Manager
