

Software Maintenance

The Client:

The client provides innovative web-based accounting and invoicing services. These services are offered in a software-as-a-service (SaaS) model and provide the benefits of economies of scale and increased efficiency to their customers.

Challenges:

The client needed a reliable partner that could enhance the application while stabilizing it with their growing product development needs.

The desired team had to have very strong analytical skills, a solid grasp of LAMP technologies, and a good understanding of Zend framework.

Solution:

Optimus' team rapidly embarked on plan based on requirements. This helped set up the engineering practices and acquisition of domain knowledge.

Once best practices and domain knowledge were acquired, Optimus was able to work with the client to improve their offering.

Optimus' team now works as an extension of the client's technology team and provides them with seamlessly integrated development, maintenance and testing services.

Benefits:

Optimus has successfully established an offshore team, coupled with on-shore coordinator that began delivering revenue generating value in the very early stage of the relationship.

Optimus' proven ability to deliver a light weight agile framework ensured minimal overhead for the client.

Optimus' team is now fully integrated with the client's team and continues to play the role of a proactive partner rather than a conventional vendor.

Conclusion:

Optimus' services are provided in a flexible model that enables the client to maintain their application while managing their expenses during development cycles.

“Working with Optimus has strengthened my technology team by giving them access to skilled developers. We consider Optimus part of our team.”
