

## Software Testing

### The Client:

*The client builds video analytics software and hardware that monitors foot traffic. Cameras and appliances are installed at different locations of a premise to capture foot traffic patterns. The software then generates analytic reports.*

---

### Challenges:

The client's team was focused on development and needed a testing team to thoroughly test the accuracy of the reports generated by the application.

The web-based application required 'black-box' testing and a QA team that could work closely with developers in an Agile mode.

The client needed a testing team skilled in agile QA testing.

### Solution:

Optimus worked closely with the client's technology team to acquire knowledge and develop a testing process.

Once a process was established, Optimus' offshore team was able to conduct consistent iterative testing. Offshore work is reviewed by Optimus' local manager who works closely with the client.

Testing results are communicated directly with the client's development team enabling issues and enhancements to be addressed quickly.

### Benefits:

The client is now confident that their product meets the quality expectations of the market.

This partnership has also enabled the client's team to focus their effort on development.

The client has since been able to reduce time to market in a cost efficient way.

### Conclusion:

With Optimus helping the client conduct testing, our client has been able to dramatically improve R&D effectiveness.

"Optimus has enabled us to improve our product by freeing up our resources. Now that we focus on what we're good at, our delivery times have greatly improved."

~Product Manager
